Lab 6 DML and TCL Statements

All questions use data from the MGS Schema.

To test whether a table has been modified correctly as you do these exercises, you can write and run an appropriate SELECT statement.

1. Write an INSERT statement that adds this row to the Categories_mgs table:

   category_id: 5

   category_name: Brass

   Code the INSERT statement as part of a script so Oracle commits the change.

   NOTE – You are required to submit two statements: 1 INSERT statement, 1 transaction control statement.

2. Write an UPDATE statement that modifies the row you just added to the Categories_mgs table. This statement should change the product_name column to "Woodwinds", and it should use the category_id column to identify the row.

   NOTE – You are required to use the category_id column in the condition to choose the row to update.

3. Write a DELETE statement that deletes the row you added to the Categories_mgs table in Question 1. This statement should use the category_id column to identify the row.

   NOTE – You are required to use the category_id column in the condition to choose the row to update.

4. Write an INSERT statement that adds this row to the Products_mgs table:

   product_id: 11
   category_id: 4
   product_code: dgx_640
   product_name: Yamaha DGX 640 88-Key Digital Piano
   description: Long description to come.
   list_price: 799.99
   date_added: the date when the INSERT statement is executed.

   You are required to use a column list in your INSERT statement.

   HINT – you need to use a function to get the date when the INSERT statement is executed, which varies depending on when you run the query.

5. Write an UPDATE statement that modifies the product you added in Question 4. This statement should change the discount_percent column from 0% to 35%. This statement should use the product_code column to identify the row.

   NOTE – You are required to use the product_code column in the condition to choose the row to update.

6. Write a DELETE statement that deletes the Keyboards category.

   You will need the category id of the Keyboards category. Write a SELECT statement to find this category id.

When you execute this DELETE statement, it will produce an error if the Keyboards category has related rows in the Products_mgs table. To fix that, precede the DELETE statement with another DELETE statement that deletes all products in this category.

NOTE – You are required to submit three statements: one SELECT statement and two DELETE statements.

7. Write an INSERT statement that adds this row to the Customers_mgs table:

customer_id:	9
email_address:	rick@raven.com
password:	sesame
first_name:	Rick
last_name:	Raven

NOTE - You are required to use a column list in your INSERT statement.

8. Write an UPDATE statement that modifies the Customers_mgs table. Change the password column to "secret" for the customer with the email address: rick@raven.com.

9. Write an UPDATE statement that modifies the Customers_mgs table. Change the password column to "reset" for every customer in the table.

10. Code a ROLLBACK statement that rolls back all changes you make in the previous 9 steps.

11. Open the script named create_mgs_tables_new.sql and run this script.

Rerun the script will make sure that the data in the MGS schema are restored for future labs.

You don't need to submit anything for this step.

NOTES:

- **IT'S IMPORTANT THAT YOU COMPLETE THIS STEP.**
- **OTHERWISE YOU MAY NOT COMPLETE FUTURE LABS CORRECTLY.**
